Education

Université Paris 1 Panthéon-Sorbonne <i>M1 Mathématiques Appliquées à l'Économie et à la Finance (MAEF)</i>	2025 – 2026 <i>Paris, France</i>
Université Paris Dauphine-PSL <i>Bachelor in Mathematics & Physics</i>	2025 – 2026 <i>Paris, France</i>
Université de Lille <i>Bachelor in Mathematics - Research track</i>	2024 – 2025 <i>Lille, France</i>
EDHEC Business School <i>Grande École Program, Master in Management</i>	2024 – 2028 <i>Lille, France</i>
Lycée Notre Dame de Sion <i>CPGE MPSI/MP</i>	2021 – 2024 <i>Marseille, France</i>

Relevant Coursework

- Statistical Learning
- Time Series Analysis
- General Relativity
- Statistical Physics
- Functional Analysis
- PDE Theory
- Data Analysis
- Machine Learning

Experience

SAMM Laboratory, Université Paris 1 <i>Research Intern – Supervised by <u>Alain Celisse</u></i>	March 2026 – July 2026 <i>Paris, France</i>
• Developing a contrastive learning framework based on Mamba (Selective State Space Models) to classify variable stars from irregularly sampled OGLE-IV light curves (Cepheids, RR Lyrae, Eclipsing binaries, Miras, δ Scuti). • Investigating the geometric structure of learned latent representations, deriving Lipschitz bounds in the selective state space to support a causal analysis of variability classes. • Building a full preprocessing pipeline parsing raw OGLE-IV photometric data into tensors directly compatible with SSM-based architectures.	

EuroCTP <i>Data analyst</i>	June 2025 – August 2025 <i>Amsterdam, Netherlands</i>
• Processed high-frequency event-driven data streams from major execution venues at tick resolution (BMLL Data Lab). • Reconstructed consolidated tape states from multi-venue asynchronous streams; identified temporal ordering inconsistencies and inter-stream desynchronisation. • Estimated timing-induced biases in volatility and liquidity measures across fragmented venues under asynchronous reporting. • Contributed to a research report submitted to ESMA's consolidated tape tender, documenting data quality benchmarks and cross-venue consistency metrics.	

Projects

Online FDR Control with e-values for jump detection 🌐	2025 – 2026
• Designed an online jump detection pipeline based on e-LOND and e-GAI procedures with composite e-values for semi-martingales with unknown spot volatility. • Compared FDR-controlled detections against classical Lee–Mykland tests on simulated Lévy jump-diffusion processes to assess power and calibration. • Produced a state-of-the-art document at the intersection of FDR control, alpha investing and jump detection.	

Technical Skills

Languages: Python, R, SQL, C, $\text{\LaTeX}$
Libraries / Frameworks: PyTorch, PySpark, NumPy, Pandas, Scikit
Tools: Git, Jupyter, VS Code
Certifications: TOEIC 915/990; TOSA Excel
Languages (spoken): French (native), English (C1), Arabic (B2)
